

The Formentera Office of Rural Environment has launched a push to curb trichinosis by testing pig meat from animals which were slaughtered domestically.

Trichinosis is a parasitic disease that can be transmitted to humans through raw or undercooked pork, wild boar and horse meat and sausages such as sobrassada which have not been heat-treated. To avoid it, pork from traditional matances should be tested for trichinae.

Formentera residents who wish to have meat tested have until 30 March 2023 to contact the Formentera Office of Agriculture and Livestock (Centre Antoni Tur "Gabrielet"). The office can be reached via email at veterinari@conselldeformentera.cat or, by phone, at 971 321 087.

Interested parties can receive material and instructions for taking samples and, afterwards, the Consell de Formentera veterinary service will test slaughtered pig meat for trichinosis to ensure its fitness for home consumption. This service is free of charge.

Campanya per
**CONTROLAR LA
TRIQUINOSI EN LES
MATANCES DE PORCS**

De l'1 de novembre de 2022 al 30 de març de 2023

La triquinosi és una malaltia parasitària que es pot transmetre als humans a través de:
1. La carn de porc crua o poc cuinada (bandes de porcs senglers i de cavalls)
2. Embolots no sotmesos a tractament tèrmic, com ara la sobrassada.

Per evitar-ho, s'ha de sotmetre la carn de porc procedent de matances tradicionals a una
ANÀLISI DE TRIQUINA

Informació a la **CONSELLERIA D'AGRICULTURA I RAMADERIA**
situada al Centre Antoni Tur "Gabrielet"
veterinari@conselldeformentera.cat | 971 321 087

Us facilitarem:
• Material i instruccions per a la presa de mostres
• Des del servei veterinari del Consell es realitzaran les anàlisis perquè el consum de porcs sacrificats sigui segur. **Aquest servei és gratuït.**
