

The Formentera Department of Environment reports that members of the regional environment committee, or CBMA, voted yesterday in plenary to grant integrated environmental authorisation to the Es Ca Marí plant. Local environment chief Antonio J Sanz pointed out that the move, which was backed by Consell de Formentera, establishes corrective strategies —on waste treatment, for example, or measures tackling vibrations, noise and gas emissions— to “put the plant on the right side of technical and environmental issues so installation of the third cable can proceed”.

And, the area around the power plant must be equipped with four fixed measuring stations to take sound readings to ensure it stays within an appropriate range morning, afternoon and night.

The changes must be applied before the plant incorporates generators to supply the power required for the substation. Today’s approval puts the power plant on stable administrative footing as well.

Conseller Sanz applauded “the CBMA, the energy and climate change division of the Balearic government and our administration work in recent months” and presaged “a swift and much-anticipated end to the troubles of area residents”.
